

★ = knee, the smallest budget within 2% of the 8192-SPU limit. Below 10 ms both cards sit left of their knee — a datacenter deployment is under-provisioned, not over. Above 10 ms both sit right of it: at 30 ms, 256 SPU reaches L40S's 192-SPU result and 512 reaches B200's 2048. SPU count is not a free parameter; the dashed segments would need a different memory organisation.
