

L40S — 24 ch ceiling (192 SPU)

B200 — 256 ch ceiling (2048 SPU)

★ = knee, the smallest design within 2% of the full card; the label is its SPU count. L40S shows no knee— at 24 channels it never reaches the network-bound regime, so its whole design space is worth building. B200 does: at 20 ms, 768 SPU delivers 98% of what 2048 does for 37% of the area. Curves for the same α are directly comparable; area is PIM logic only, not the DRAM it sits in.
